Typical Sample Questions from Question 5090 and Their Analysis To illustrate the depth and application of Question 5090, here are sample questions with detailed explanations:

Sample Question 1: Which of the following organelles is primarily responsible for energy production in the cell? a) Nucleus b) Mitochondria c) Golgi apparatus d) Endoplasmic reticulum
Correct answer: b) Mitochondria
Analysis: This question tests basic cell biology knowledge. Mitochondria are known as the powerhouses of the cell, generating ATP through cellular respiration. The nucleus controls genetic information, the Golgi apparatus processes and packages proteins, and the endoplasmic reticulum synthesizes lipids and proteins.

Sample Question 2: In humans, the ABO blood group system is an example of which type of inheritance? a) Complete dominance b) Codominance c) Incomplete dominance d) Multiple alleles inheritance
Correct answer: d) Multiple alleles inheritance
Analysis: The ABO blood group involves three alleles: IA, IB, and i. The presence of multiple alleles exemplifies multiple alleles inheritance, leading to different phenotypes based on allele combinations. This question assesses understanding of inheritance patterns beyond simple dominance.

Sample Question 3: What process accounts for the genetic variation observed in meiosis? a) DNA replication b) Independent assortment and crossing over c) Mitosis d) Fertilization
Correct answer: b) Independent assortment and crossing over
Analysis: Genetic variation in meiosis arises primarily from crossing over (exchange of genetic material between homologous chromosomes) and independent assortment (random distribution of chromosomes). DNA replication occurs before meiosis, mitosis does not contribute to variation, and fertilization combines genetic material but is not responsible for variation within meiosis itself.
